SURVEYING INTERTIDAL ZONES

Marlan Maritime Technologies, NOC and the **University of Liverpool** have developed a method of surveying intertidal areas using marine radar.

Robust, long term survey data from these dynamic regions was previously very difficult and expensive to obtain. This new technique facilitates unmanned data collection over large coastal areas, cost effectively.

“The wealth of expertise at the NOC has proved invaluable and helped us to avoid fruitless R&D effort, this project has opened our eyes to the breadth of opportunities that are available through collaboration with the NOC.”
