

MYRTLE X

6,000m
Max Depth

2.20x2.20x1.50m
Dimensions

MYRTLE X is a platform for carrying a range of sensors down to the sea floor. Data is then recorded within its yellow capsules which are then individually released over time. Once released the capsules are able to float to the surface where they transmit data directly back to base.

MYRTLE X can operate at depths up to 6000m and will release capsules for up to ten years.
